Summary

Frontend engineer, 4+ years in React and TypeScript, split between user-facing product work and the developer-facing infrastructure underneath it. Most recently maintained an in-house design system used by up to 24 developers and led incremental migrations across the apps built on it, without pausing feature work. Scientific software background: dense data, D3 visualizations, document editors, and the performance work that keeps them usable. Based in Yerevan (UTC+4), working remotely as an independent contractor.

Experience

Software Engineer · Quantori

05.2023 – 09.2026

Design systems

- Built and maintained an in-house React/TypeScript library of **73 components** consumed by **3 production apps**; core maintainer, reviewing every change (~100 releases across 8 major versions, published to a private npm registry).
- Designed a **component deprecation mechanism** that made breaking changes safe to ship: warnings stay visible but never block work. Apps migrated after a single announcement and a few small PRs of mine, scoped to minimize merge conflicts.
- Audited components against design mockups and, with the design team, reworked core component APIs (Button, Dialog, Tooltip, Select), standardized theming, and improved accessibility (keyboard navigation, ARIA, screen-reader support).
- Acted as the bridge between the library and consuming apps for 2+ years: version upgrades, replacing deprecated components, cross-repo bug triage, release announcements.

Modernization & migration

- Declined to extend a Redux store already slated for replacement; introduced its MobX successor alongside it for the new feature, joined by a connector designed to be removed at full migration.
- Led the migration from **SASS to CSS-in-JS** across ~25 incremental PRs, replacing legacy styling and ad-hoc components with the shared library and its theming.
- Drove React 19 adoption and JS-to-TypeScript / class-to-hooks modernization across 3 repositories.

Testing & infrastructure

- Built a **visual-regression testing framework** from scratch (Storybook + Puppeteer + jest-image-snapshot), running on every PR to catch UI regressions.
- Set up integration-test workflows (per-package triggers, PR failure reporting) and fixed the publish/release pipelines.
- Exposed and documented all library types for consumer apps, and led type-aware ESLint upgrades that catch errors at build time.

Product features. Shipped **rich-text document editing** with custom chemistry components for an electronic lab notebook, and eliminated its state-driven re-render storms: ~200 ms faster interactions on average, **800 → 300 ms** in the worst cases. Designed the notebook's error-boundary model, scoping failures to the affected component rather than blanking the whole entry. Also built interactive **D3 dose-response plots** for scientists to explore, annotate, and export data; search and filtering with saved, shareable views; and hardened save reliability and access control for sensitive research data.

Leadership & mentorship. Led a team of 4 interns through the company's training initiative over 2 months, building a Node.js/TypeScript/React LIMS application from scratch — development cycle, architecture direction, code review, hands-on instruction; one trainee was subsequently hired full-time.

Frontend Engineer (Intern) · Chatium

01.2023 – 02.2023

Developed both frontend and backend code for a rich text editor in a proprietary React/TypeScript SSR framework for a no-code app-builder platform, ramping up and delivering independently in an environment with no documentation or onboarding.

Freelance Frontend Developer

09.2022 – 04.2023

- Built a **Leaflet.js** viewer for extreme-high-resolution scientific imagery (vanilla JS), streaming image tiles from cloud storage; the project reached the semifinals of a scientific contest at St. Petersburg State University.
- Delivered a client landing page end-to-end (HTML/CSS/JS, Bootstrap, Google reCAPTCHA, PHP mailer).

Earlier, non-engineering roles omitted for relevance.

Skills

Languages	TypeScript, JavaScript (ES6+), HTML / CSS
Frontend	React (16–19), design systems & component libraries, CSS-in-JS (styled-components), MobX, Redux, D3.js, accessibility (a11y)
Testing	Jest, React Testing Library, visual regression testing (Storybook + Puppeteer)
Tooling & infra	GitHub Actions (CI/CD), pnpm workspaces / monorepos, Webpack, Rspack, Docker, Node.js
Personal projects	Astro, Preact, nanostores, Tailwind CSS, Prisma, Zod, Firebase, Cloudflare Workers
AI-assisted dev	Claude Code (daily driver)
Languages (spoken)	English (C2), Russian (native)

Education

Associate in Nursing — Moscow Medical College, 2016

Projects

Content-driven Astro sites — a TTRPG companion with a live character sheet (embedded interactive Preact SPA), and a MechWarrior data-viz site sourced from game data. Full (playful) CV and project links: **career200.github.io/CV**
