

Dmitriy Zhukov

Frontend Engineer

[Yerevan, Armenia] · [linkedin.com/in/dzhukov404] · [github.com/career200] · [t.me/zhukontime]

Summary

Experienced frontend engineer focused on the shared, high-leverage layer within large teams — design systems, build tooling, and testing infrastructure. 3+ years in scientific software: built a component library used across multiple production apps, then led their migration onto it (TypeScript, React 19, CSS-in-JS), backed by visual-regression testing built from scratch. Also ships user-facing features — data vizualization, rich-text editing, search and filtering, performance improvements. Passionate about developer experience, code quality, and well-designed APIs. Open to new opportunities.

Experience

Software Engineer · [Quantori] · [05.2023 – Present]

Design systems

- Built and maintained an in-house React/TypeScript library of 73 components consumed by **3 production apps**; core maintainer (~100 releases across 8 major versions).
- Revised and audited common components, identifying and fixing inconsistencies with and within the design mockups, along with behaviors and prop scopes.
- Researched, developed and refined core components in tight cooperation with design team, simplifying feature development, upgraded and standardized theming across applications and improved accessibility (micro-interactions and visual feedback, keyboard navigation, screen-reader support).
- Designed a **component deprecation mechanism** adopted by all 3 consuming apps, enabling safe breaking changes.

Modernization & migration

- Led the migration from **SASS to CSS-in-JS**, eliminating legacy styling entirely across ~25 incremental PRs and refactoring application code to use the shared library components and theming instead.
- Drove the **React 19** upgrade and **JS to TypeScript** / class to hooks modernization across 3 repositories.
- Acted as the bridge between the library and consuming apps for 2+ years — version upkeep, replacing deprecated components, triaging and fixing component bugs across repositories.

Testing & infrastructure

- Built a **visual-regression testing framework from scratch** (Storybook + Puppeteer + jest-image-snapshot), running on every PR and preventing UI regressions across the library.
- Set up integration-test workflows (per-package triggers, PR failure reporting) and fixed

publish/release pipelines to streamline the development process and ensure library stability.

- Enhanced the typing and exposed all library types to consumer apps with appropriate documentation, simplifying component usage flow for developers.
- Led **type-aware ESLint** upgrades, catching errors at build time and improving code quality across repositories.

Product features Built interactive **D3 dose-response plotting** features for scientists to explore, annotate, and export data. Shipped **rich-text document editing** with integrated custom data-driven chemistry components for an electronic lab notebook. Implemented **search and filtering** with saved, shareable views, and hardened **save reliability** and **access control** for sensitive research data, improved **performance** of data-heavy pages by eliminating state-driven re-render storms.

Leadership & mentorship Lead a team of 4 interns through the company's training initiative over 2 months, building a NodeJS/TypeScript/React LIMS application from scratch — development cycle, architecture direction, code review, hands-on instruction; one trainee was **subsequently hired full-time**.

Frontend Engineer (Intern) · [Chatium] · [01.2023 – 02.2023]

Developed both frontend and backend code for a rich text editor in a proprietary **React/TypeScript** framework for a no-code app-builder platform, ramping up and delivering independently in an environment with no documentation or onboarding.

Freelance Frontend Developer · [09.2022 – 04.2023]

- Built a **Leaflet.js** viewer for extreme-high-resolution scientific imagery (vanilla JS), streaming image tiles from cloud storage; the project reached the **semifinals of a scientific contest at St. Petersburg State University**.
- Delivered a client landing page end-to-end (HTML/CSS/JS, Bootstrap, Google reCAPTCHA, PHP mailer).

Earlier, non-engineering roles omitted for relevance.

Skills

Languages: TypeScript, JavaScript (ES6+), HTML / CSS **Frontend:** React (16–19), design systems & component libraries, CSS-in-JS (styled-components), MobX, Redux, D3.js, accessibility (a11y) **Testing:** Jest, React Testing Library, visual regression testing (Storybook + Puppeteer) **Tooling & infra:** GitHub Actions (CI/CD), pnpm workspaces / monorepos, Docker, Node.js **Personal projects:** Astro, Tailwind CSS, Prisma, Zod, Firebase

Education

[Associate in Nursing] — [Moscow Medical College], [2016]

Projects

Build content-driven **Astro** sites — TTRPG companion with a live character sheet (embedded interactive Preact SPA), MechWarrior data-viz site sourced from game data. Full (playful) CV and project links: **[career200.github.io/CV/]**
